### IN4MATX 133: User Interface Software

Lecture 3: CSS

Professor Daniel A. Epstein TA Goda Addanki TA Seolha Lee

- We were able to get a larger classroom (whenever in-person resumes), so we were able to increase the number of seats
  - Room change: HH 178
- If you just joined, welcome! Last week's lectures are on the class webpage
- A0 was due Friday, so submit it ASAP (make sure you have 10/10)

- Office hours start this week (calendar has full schedule)
  - Me today 3:45-5pm
  - Goda Wednesday 2-3pm
  - Seolha Friday 11am-12pm
- We'll use breakout rooms to manage hours
  - If no one is in the "main room", be patient, we'll come & help soon

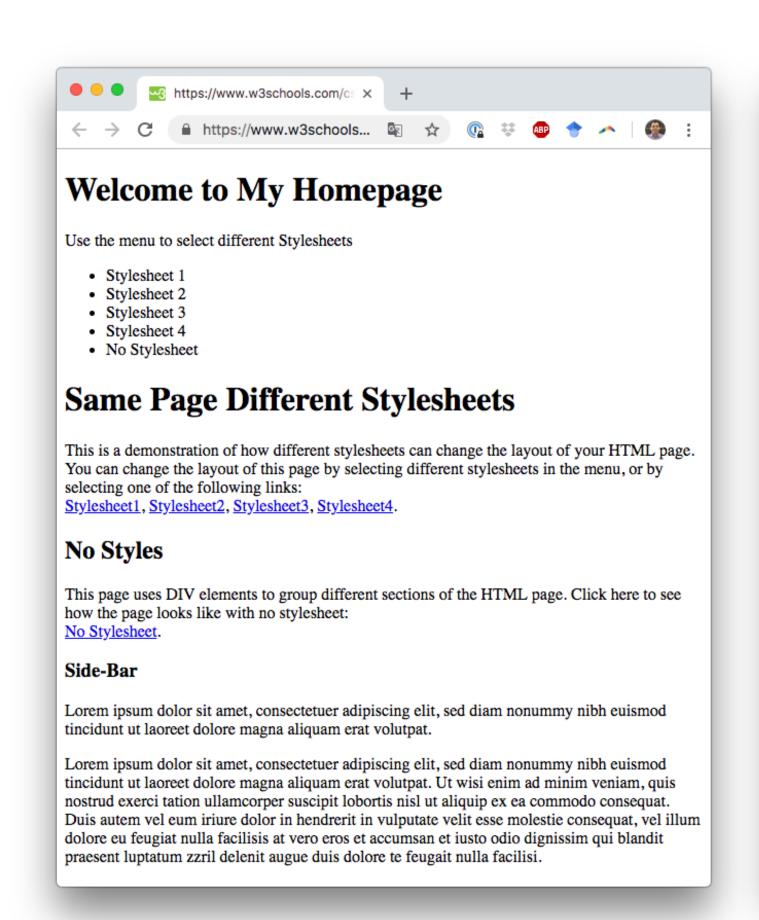

- Participation for credit, starting today
  - Via a google form linked on the class calendar page
  - If you have trouble submitting during lecture (or are watching this later),
     you have 24 hours from the end of lecture to submit answer(s)

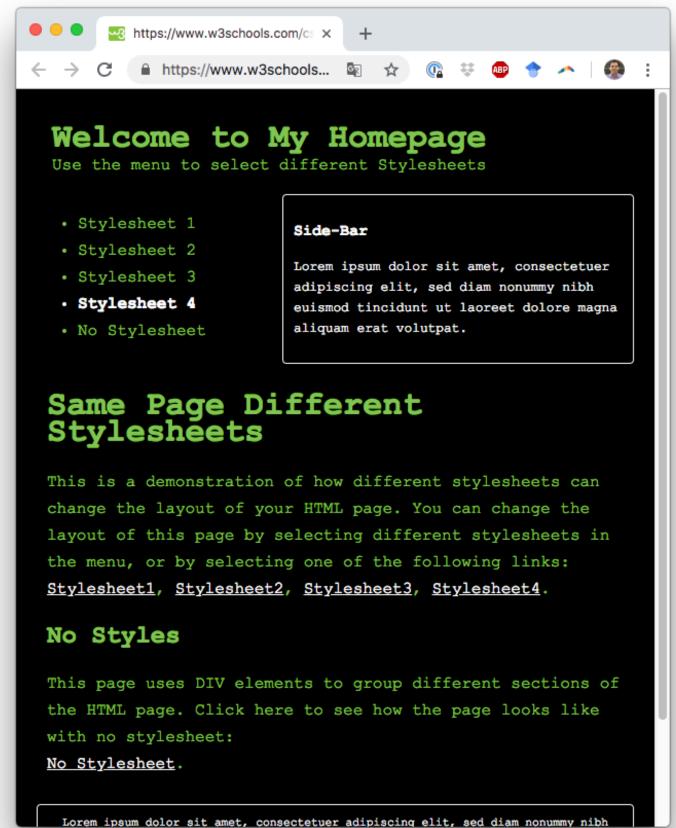

- We'll email everyone who didn't get credit tomorrow
  - To help identify issues with entry codes, late submissions, etc.
  - If you don't get an email, you've figured out the system and are all set
- We'll calculate & report final participation at the end of the quarter
  - Can't automate loading into Canvas, etc., so it's challenging to produce every time
  - Canvas won't allow for the same link for every class & live charts, which also introduces logistical challenges
  - There's probably a better way, but we don't have the bandwidth to figure it out :-)

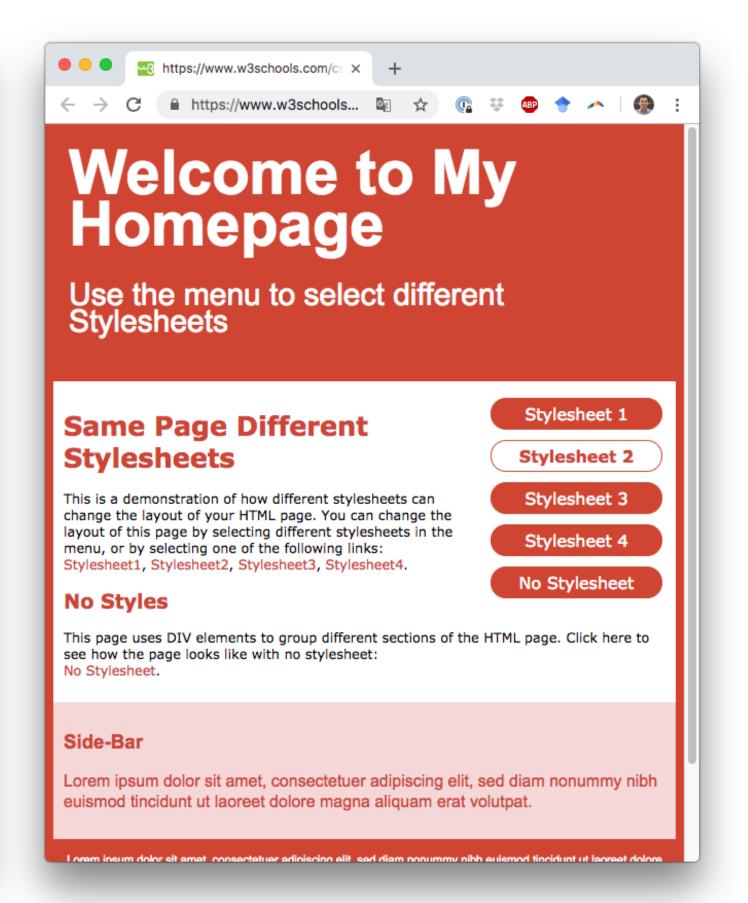

# Today: CSS

### Same page, different stylesheets

## Today's goals

#### By the end of today, you should be able to...

- Explain the goals of CSS and why it exists as separate from HTML
- Describe the CSS hierarchy and fallback structure
- Utilize the box model and positioning options to arrange content
- Style nested tags with child, adjacent sibling, and general sibling selectors

### CSS

#### Cascading Style Sheets

- Defines rules for styling
- Differs from HTML, which provides structure for the document

## CSS: but why?

- Reusability
  - Apply the same style to multiple web pages
- Modularity
  - Include multiple stylesheets that apply to a single page
- Sane management
  - Files can be version controlled, separate from HTML structural content
- Maintainability
  - Easier to find a page's style

# Ok, so how do I write CSS?

### CSS syntax

- Selectors specify which elements a rule applies to
- Rules specify what values to assign to different formatting properties

```
/* CSS Pseudocode */
selector {
    property: value;
    property: value;
}
```

### CSS syntax

• Link to stylesheets in HTML's <head>

### Element, ID, and Class selectors

element: what tag is being styled

class: a type of element

• id: one specific element

```
font-family: 'Arial';
 color: red;
.emphasize {
 font-family: 'Arial';
 color: red;
#ijedtext {
 font-family: 'Arial';
 color: red;
```

### HTML Class and ID attributes

```
<div class="widget foo" id="baz"></div>
```

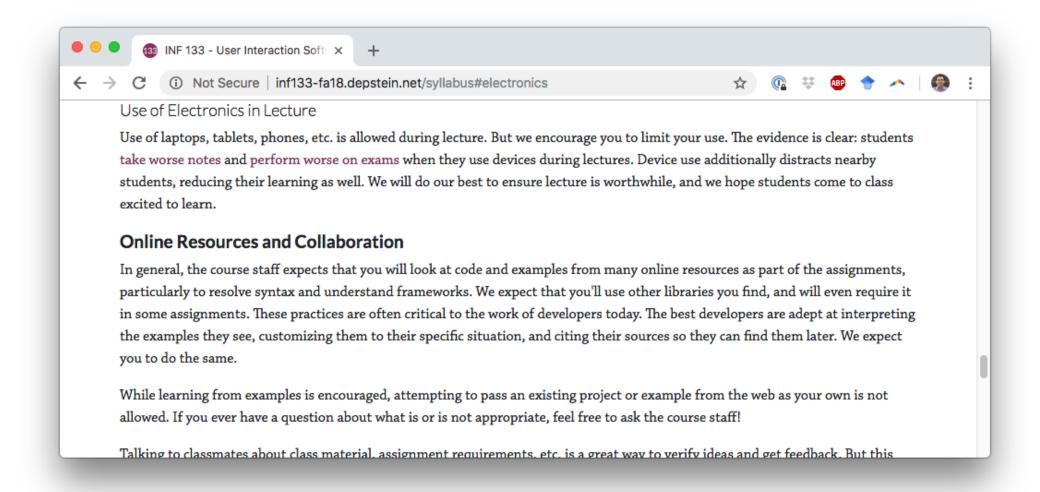

- Variable-value just like any other attribute (href, src)
- An element can have many classes, only one ID
- Each page can have only one element with a given ID
  - Required to pass validation
- Can use the same class on multiple elements
  - And should; it's useful to apply the same style to many elements

#### HTML Class and ID attributes

```
<div class="widget foo" id="baz"></div>
div.widget.foo#baz {
  /*can chain selectors together!*/
}
```

### HTML Class and ID attributes

- Fun trick: IDs can be used for navigation
- http://example.com/#id

https://css-tricks.com/the-difference-between-id-and-class/

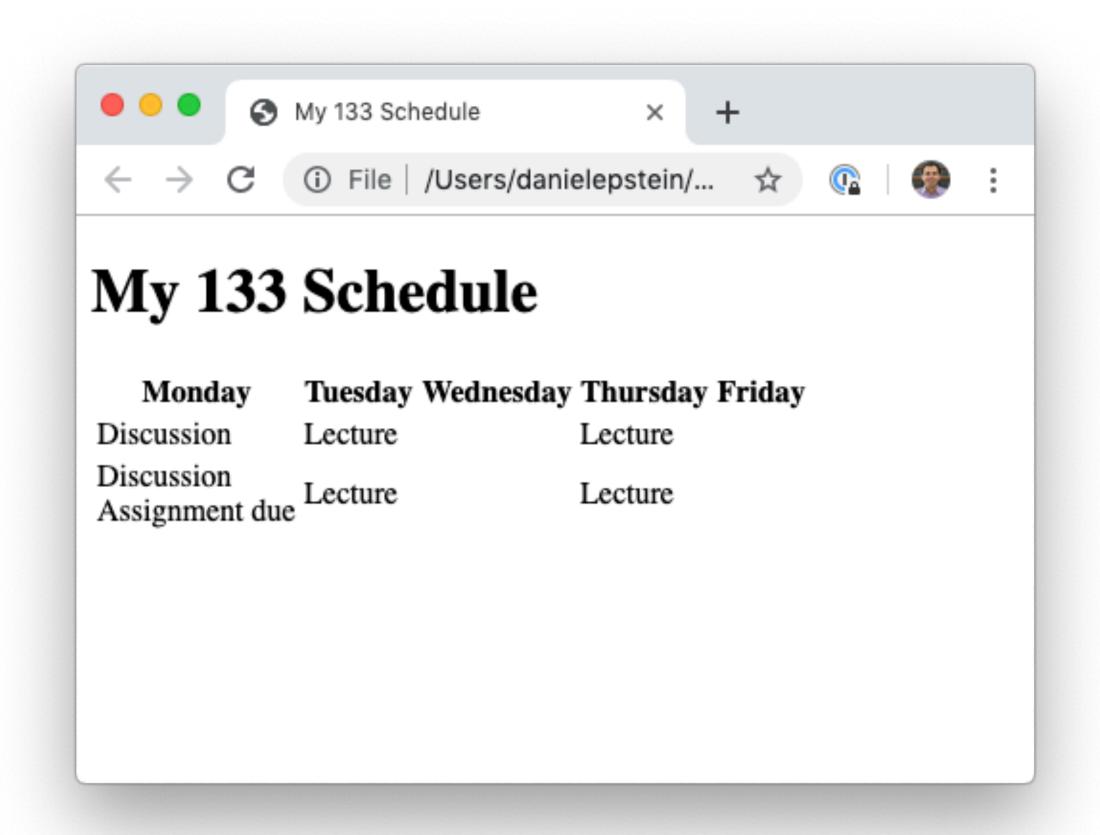

### CSS properties

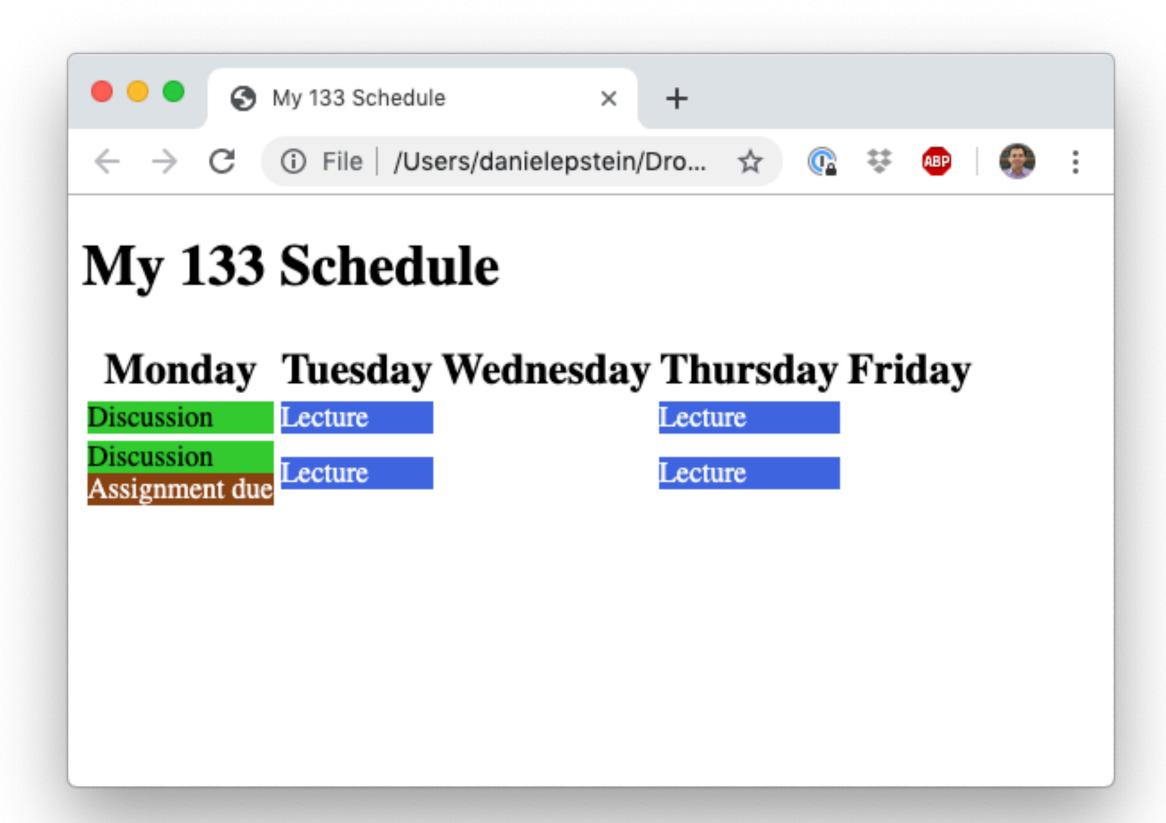

- font-family: the "font" (fallback alternatives separated by commas)
- font-size: the size of the text
- font-weight: boldness
- color: text color
- background-color (element's background)
- opacity (transparency)
- And much, much more!

http://www.w3schools.com/cssref/default.asp

### Let's style a class schedule

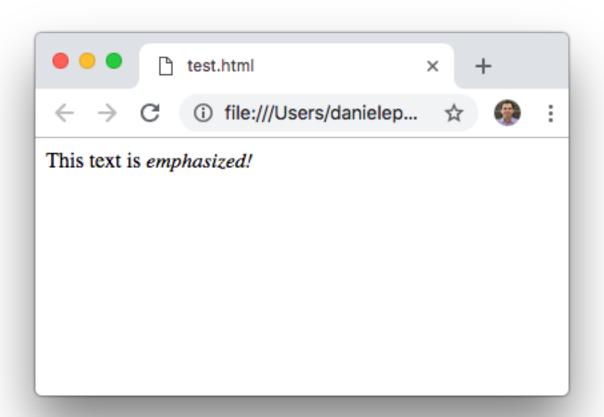

### HTML vs. CSS

- HTML specifies the semantics
- CSS specifies the appearance

#### HTML vs. CSS

```
<!--HTML-->
 This text is
<i>emphasized!</i>
Conflates appearance
and semantics
```

### </>>> zot

#### Which CSS renders

```
ZOT!
ZOT!
ZOT!
<em id="zot">ZOT!</em>
```

```
test.html × +

← → C (i) file:///Users/danielep... ☆ (ii) :

ZOT! ZOT! ZOT!
```

```
font-family: 'Verdana';
color: #0064a4; /*Blue*/
background-color: white;
}
#em {
    color: #ffd200; /*Yellow*/
    font-weight: 700; /*Bold*/
}

#para {
    font-family: 'Verdana';
    background-color: #0064a4; /*Blue*/
    color: white;
}
.em {
    color: #ffd200; /*Yellow*/
    font-style: italic;
    font-weight: 700; /*Bold*/
}
```

### </> zot

#### Which CSS renders

```
ZOT!
ZOT!
ZOT!
<em id="zot">ZOT!</em>
```

```
test.html × +

← → C ① file:///Users/danielep... ☆ ② :

ZOT! ZOT! ZOT!
```

```
A
font-family: 'Verdana';
color: #0064a4; /*Blue*/
background-color: white;
}
#em {
    color: #ffd200; /*Yellow*/

    font-weight: 700; /*Bold*/
}

#para {
    font-family: 'Verdana';
    background-color: #0064a4; /*Blue*/
    color: white;
}
.em {
    color: #ffd200; /*Yellow*/
    font-style: italic;
    font-weight: 700; /*Bold*/
}
```

### Cascading Style Sheets

Multiple rules can apply to the same element (in a "cascade")

```
<!--HTML-->
This tag has two classes: "big" and "blue"
 (classes are separated by spaces)
/* CSS */
p { font-family: 'Verdana'; }   Apply to all  tags
.big { font-size: larger; }
Apply to all with class="big"
                            Apply to all with class="blue"
.blue { color: blue; }
```

### Cascading Style Sheets

• CSS rules are also inherited from parent tags

```
<div class="content"> <!-- has own styling -->
 <div class="sub-div"> <!-- has own styling + .content styling -->
    <!-- own styling + .sub-div + .content -->
                     <!-- own style is ol AND .my-list rules-->
     <!-- li styling + .my-list + .sub-div + .content -->
     Item 1
     Item 2
     Item 3
   </div>
</div>
```

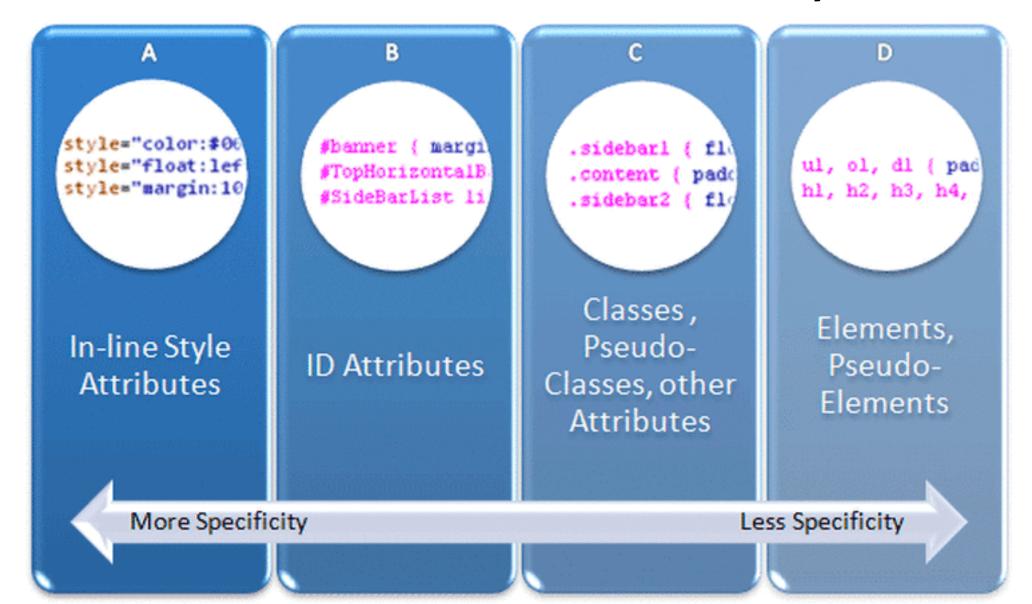

### Cascading Style Sheets

Rules are applied in order (last rule always wins among peer selectors)

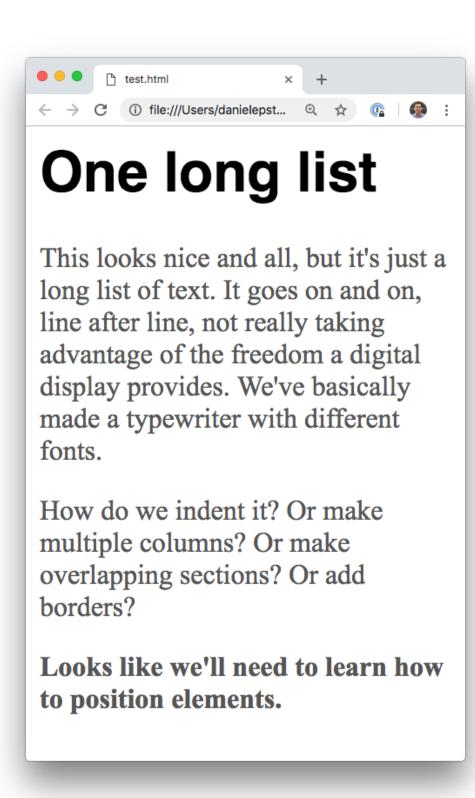

```
<!--HTML-->
<em class="blue">Text is blue!
/* CSS */
p { font-family: 'Verdana'; }
.red { color: red; }
.green { color: green; }
.blue { color: blue; }
```

## Specifying styles

- CSS specificity is calculated based on which selector designates it
- General rule: rule that's "closer to the HTML element" applies
- This is difficult stuff, usually trial-and-error resolves most things

### Our progress so far...

### Positioning

- HTML tags are either\*:
  - Block elements (line break after them)
  - Inline elements (no line break)

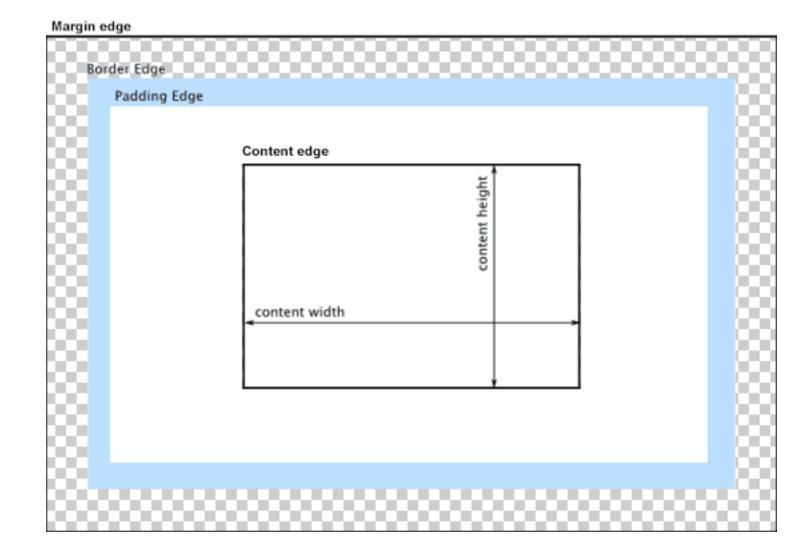

```
This is on a line.
<m>This is on the same line.</m> Inline

This will be on a new line.
```

• Don't put block elements inside inline elements!

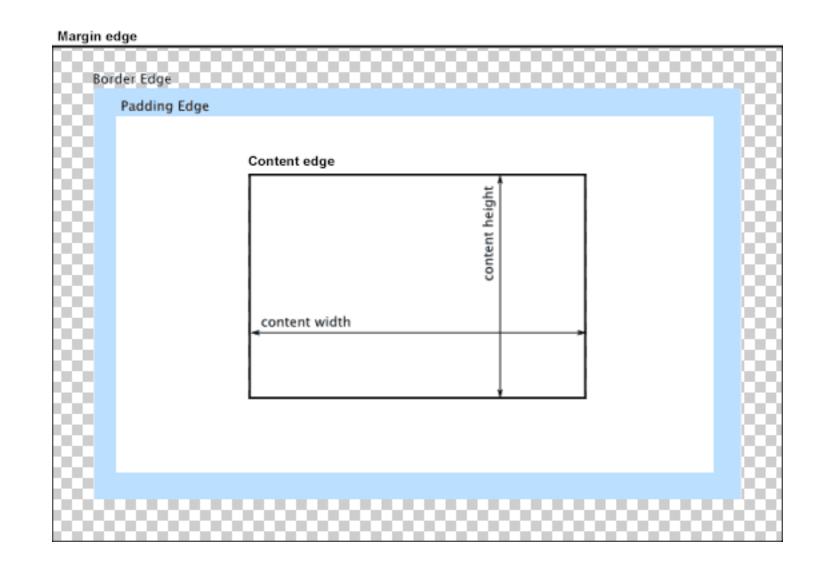

## Positioning: box model

- Content contains "real" content
- Padding extends content area
- Border is similar
- Margin is intended to separate elements from neighbors

### Positioning: box model

- Content dimensions are specified with width and height
- padding, border, and margin
   have direction properties (e.g., padding-top,
   margin-right, border-left)
- border can have border-color, border-width, and border-style
- Content color (e.g., background-color)
   extends into padding

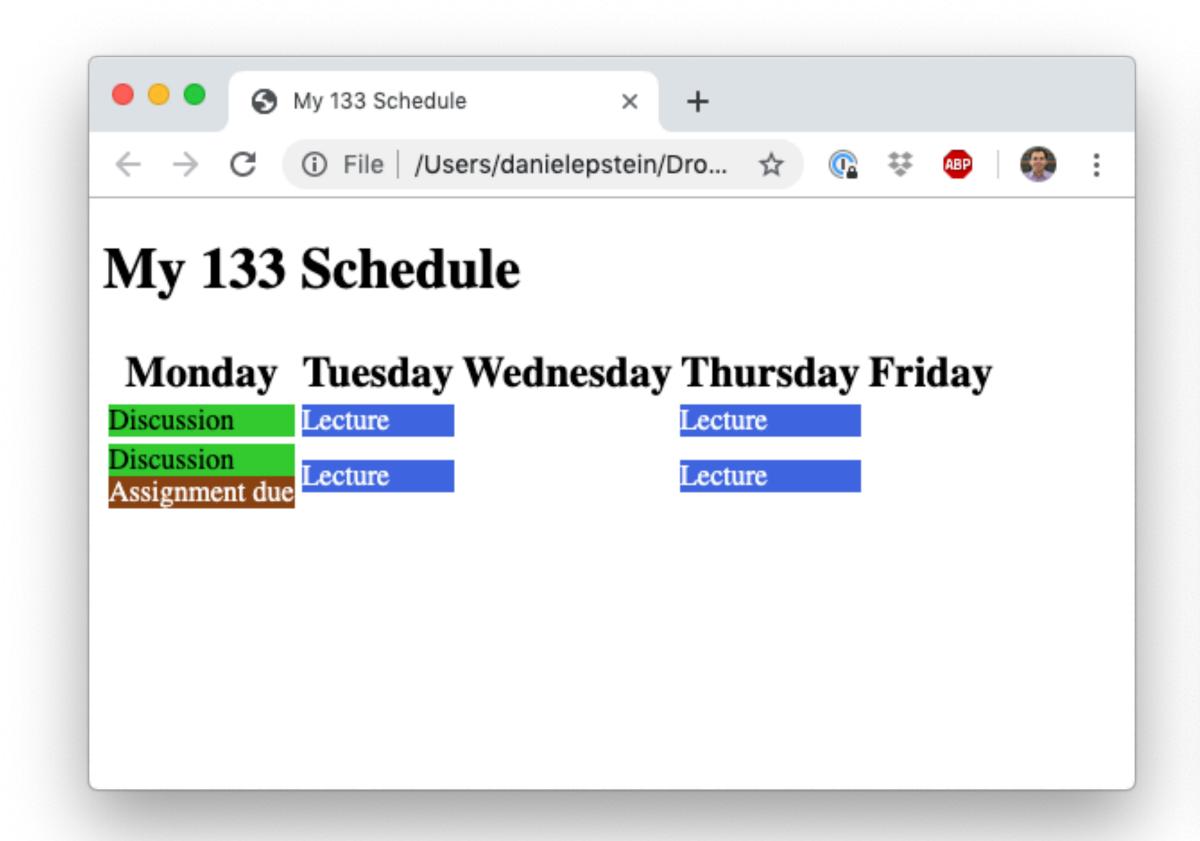

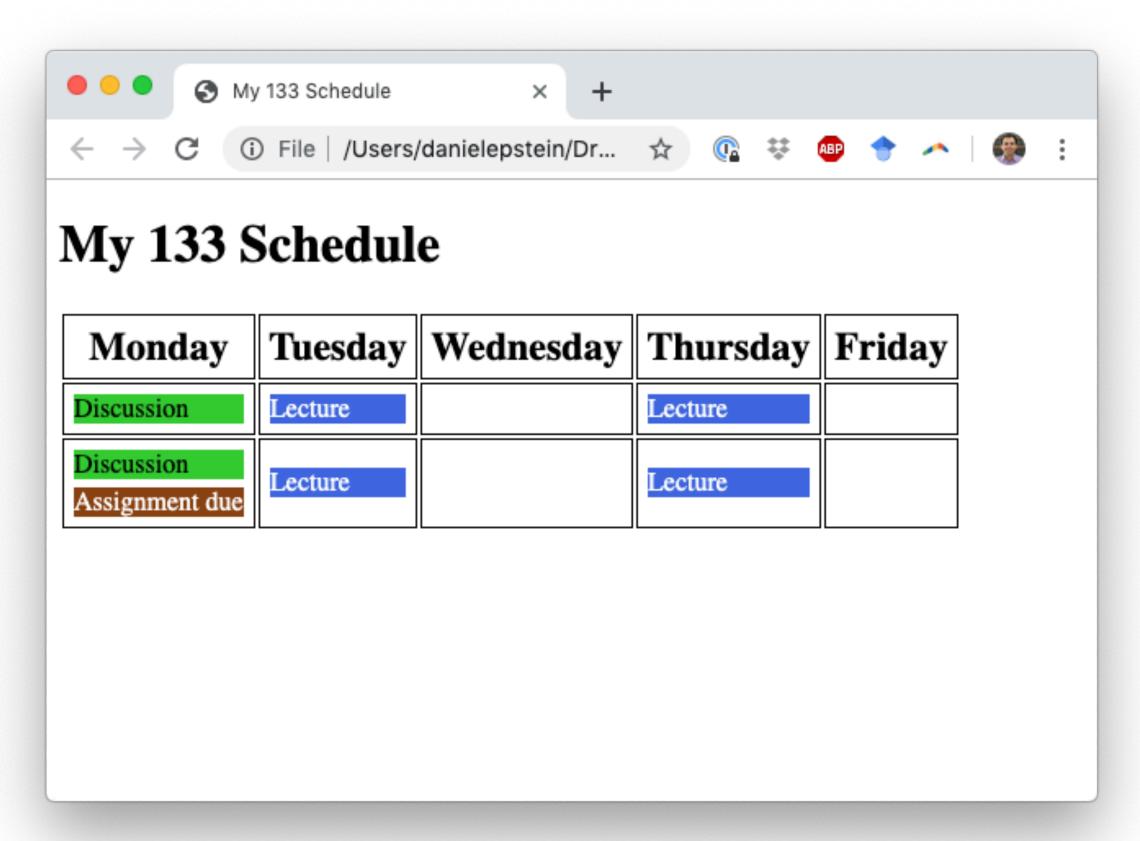

### Positioning

- All positioning is relative to the parent
  - If you nest tags, the child's margins, etc. are all dependent on parent's

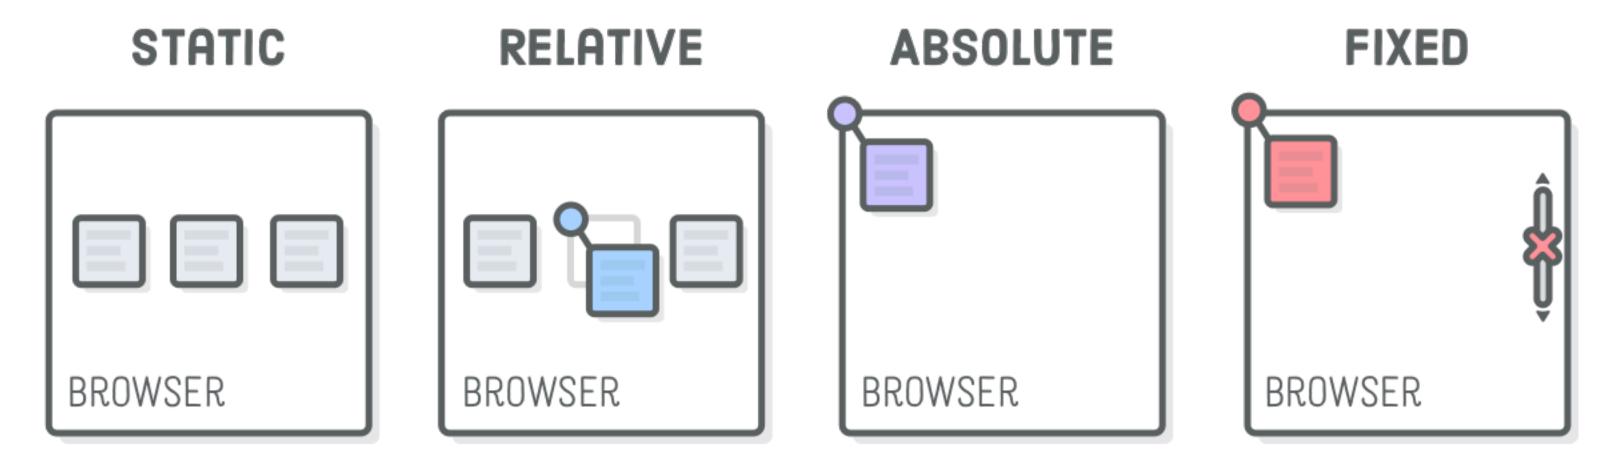

### Let's style a class schedule

### Positioning: types

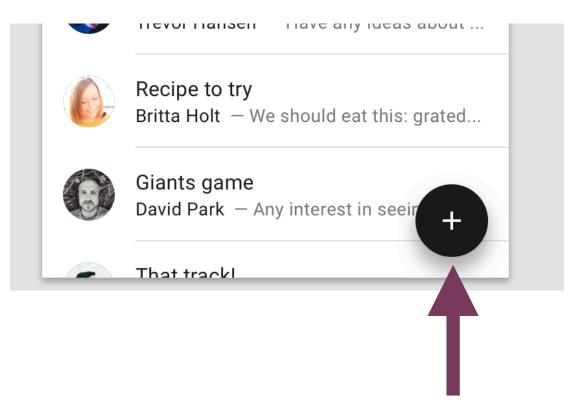

- static (default)
- relative (offset from default)
- absolute (from top-left)
- fixed (absolute + floating)

### Positioning: types

- static and relative follow the overall flow of a page
  - relative helps make adjustments to the flow
- absolute and fixed ignore it entirely
  - But they're helpful in some cases, like floating action buttons (FABs)

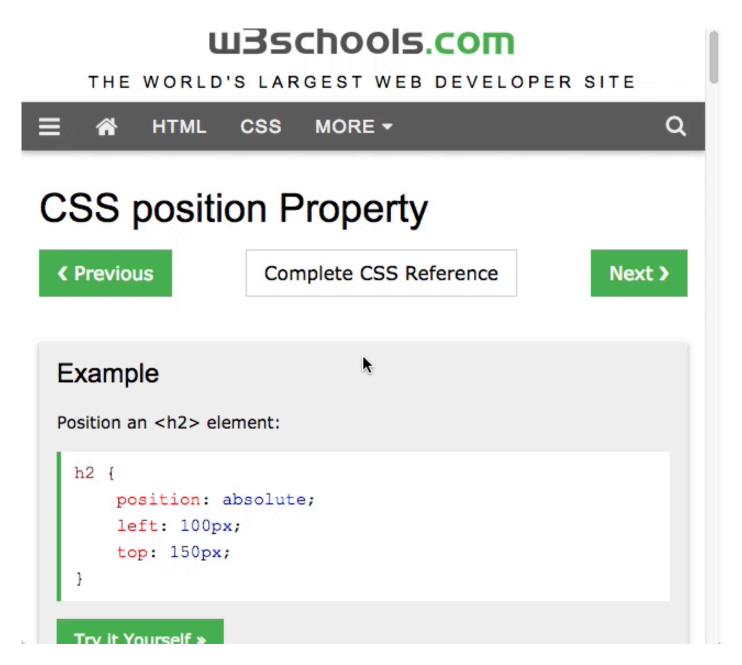

Relative position

Absolute position

### Positioning: types

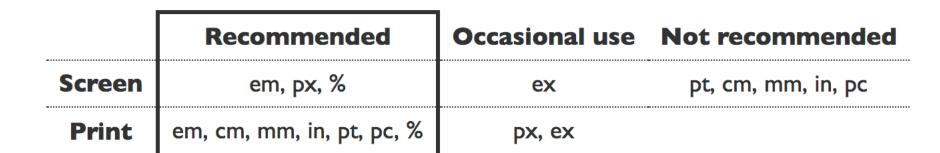

- sticky will stop when a user scrolls past it
  - Useful for menus
  - Not all browsers support it, but getting there

https://css-tricks.com/examples/AbsoluteInsideRelative/

### Units

- Pixels (px), element units (em), percentages (%), real-world units (in, cm)
- Use relative units (em, %) whenever possible
- Helps accessibility, people with low vision change default size (usually 16px)
  - Em fonts scale from the default, a 30px heading stays 30px
- Also useful to vary based on screen size
  - More on how to do that next lecture

- Extremely useful for making clean stylesheets
- Add a top margin for all h2s that follow a paragraph

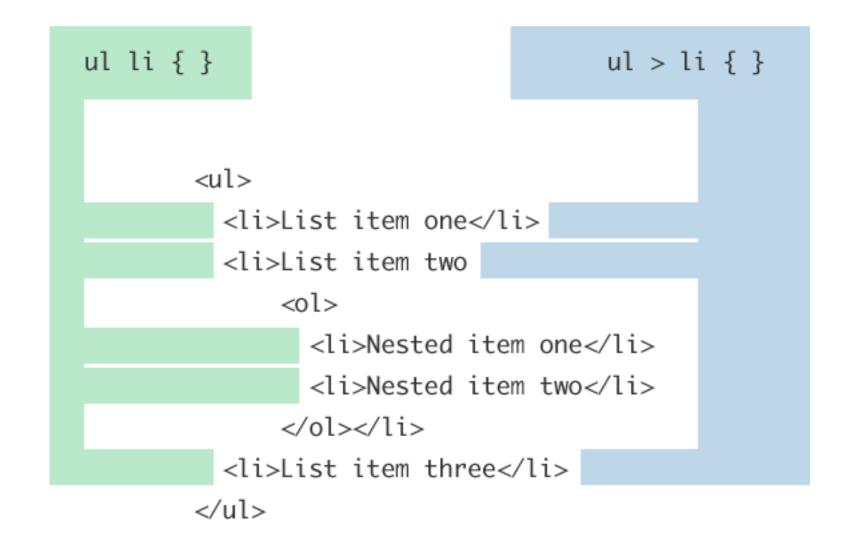

```
p + h2 {
  margin-top: 10px;
}

• Or only in a particular div
div.post p + h2 {
  margin-top: 10px;
}
```

https://www.smashingmagazine.com/2009/08/taming-advanced-css-selectors/

#### **Child and Descendant Selectors**

- ul li
  - Select all children and grandchildren
- ul > li
  - Select direct children (not grandchildren)

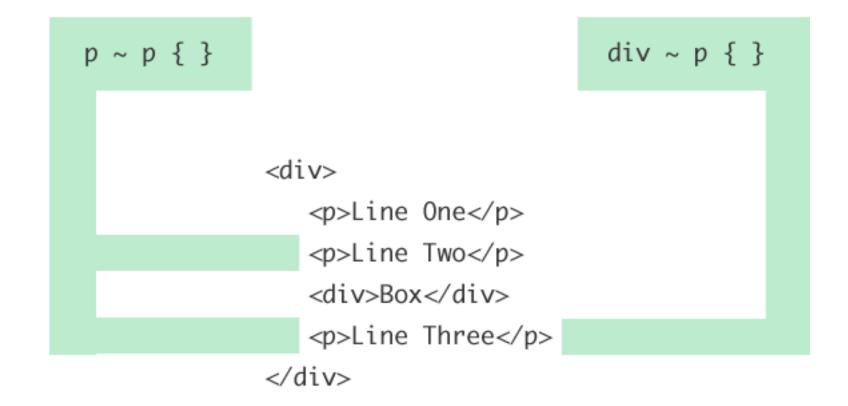

#### Adjacent Sibling Selectors

- p + p
- div + p
  - Target items immediately next to each other

#### General Sibling Selectors

- p ~ p
- div ~ p
  - Target items anywhere after the sibling

### Fonts & fallbacks

```
    Browsers will try fonts in order

p {
    font-family: "Times New Roman", Times, serif;

    Google Fonts is a great resource

<!--HTML-->
<link href="https://fonts.googleapis.com/css?</pre>
family=Roboto" rel="stylesheet">
/* CSS */
font-family: 'Roboto', sans-serif;
```

### Fallbacks in HTML

 Work similarly to CSS <video autoplay> <!--webm not supported in IE or Safari--> <source src="lecture3.webm" type="video/webm" /> <!--mp4 supported in modern browsers, but lower quality--> <source src="lecture3.mp4" type="video/mp4" /> <!--backup important for some old browsers--> <img src="lecture3.jpg" title="Your browser does not</pre> support the <video> tag"> </video>

# Fallbacks: why?

- Format not supported (webm, ogg, flac)
- Font might not support certain characters
- Might take time to load ("flash of unstyled text")
  - Pick a similar default font

The fox jumped over the lazy dog, the scoundrel.

https://css-tricks.com/css-basics-fallback-font-stacks-robust-web-typography/

There's a lot to CSS.
I can't create much
from memory alone.

# Debugging in browser

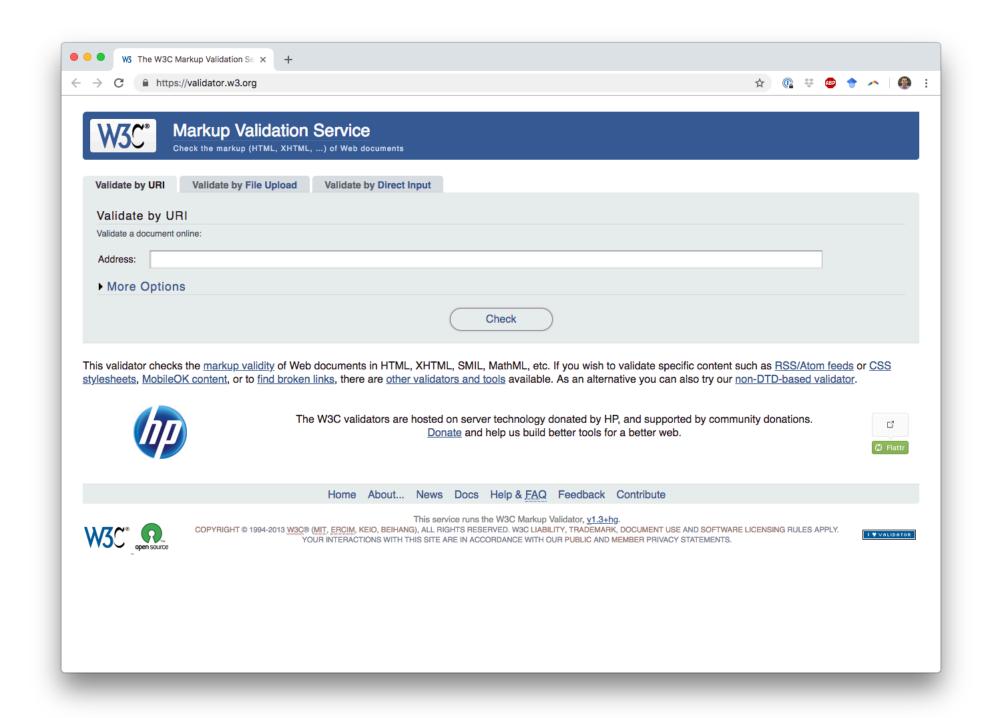

https://www.youtube.com/watch?v=Z3HGJsNLQ1E

# Browser compatibility

Used to be a much bigger issue, but still worth checking

## Validation

# Today's goals

#### By the end of today, you should be able to...

- Explain the goals of CSS and why it exists as separate from HTML
- Describe the CSS hierarchy and fallback structure
- Utilize the box model and positioning options to arrange content
- Style nested tags with child, adjacent sibling, and general sibling selectors

Professor Daniel A. Epstein TA Goda Addanki TA Seolha Lee

# **Additional slides**

#### Inline Styling

```
  Red text

  More red text
```

- Supported, but usually bad practice
  - Goes against DRY principles of programming (Don't Repeat Yourself)

#### Internal Styling

```
<head>
  <style type="text/css">
    p {font-family: 'Arial'; color:red;}
  </style>
  </head>
  <body>
    ...
  </body>
```

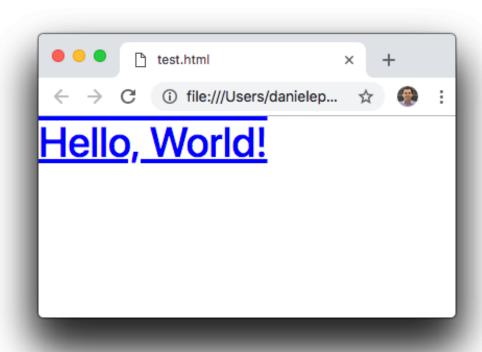

Just putting CSS into the <head> of your HTML

#### **External Styling**

- Generally a best practice
  - Aligns with the idea of separating structure from style

External styles apply in order, too!

```
<head>
    link rel="stylesheet"
    href="./css/bootstrap.css">
    <link rel="stylesheet"
    href="./css/style.css">
    </head>
    <body>
        <h1>Hello, World!</h1>
        <body>
        <body>
        </body>
```

# Positioning: shorthand

- Multiple values can be specified in one line
- Difficult to remember
- Being explicit improves readability at the expense of brevity

```
padding:10px 5px 5px 10px;
              RIGHT BOTTOM
  padding:10px 5px 10px;
                         BOTTOM
             TOP
               RIGHT and LEFT
  padding:8px 12px;
         TOP and BOTTOM
                      RIGHT and LEFT
```

https://css-tricks.com/remember-the-order-of-marginpadding-shorthand-with-trouble/

## Borders: shorthand

- Multiple values can be specified in one line
- Slightly easier to remember
- Maybe even more readable

```
div {
  border-bottom-width: 3px;
  border-bottom-style: solid;
  border-bottom-color: red;
}

div.equivalent {
  border-bottom: 3px solid red;
}
```

### Pseudo-classes

Define a special state of an element

```
/* CSS Pseudocode */
Selector:pseudo-class {
  property: value;
  property: value;
}
```

### Pseudo-classes

```
a:link { /* unvisited link */
    color: #FF0000;
a:visited { /* visited link */
    color: #00FF00;
                                   hover must be after
a:hover { /* mouse over link */
    color: #FF00FF;
                                        link and visited
a:active { /* selected link */
                                      active must be after hover
   color: #0000FF;
https://www.w3schools.com/Css/css_pseudo_classes.asp
```
